

exercise.sty : a package to typeset exercises

Paul Pichaureau
`paul.pichaureau@nerim.net`

September 5, 2004

Abstract

This package offers a simple environment to typeset exercises, and their questions, sub-questions, indications, answers and so on.

The layout of the exercises is fully customisable. Moreover, the answers of the exercise could be typeset immediately or later in the document.

1 Simple usage

This package defines two environments. The environment `Exercise` is used to typeset one exercise. For example, the following output:

Exercise 1 — Duhamel's Rule

Assume that the series $\sum x_n$ satisfies

$$\frac{x_{n+1}}{x_n} = 1 - \frac{b}{n} + \frac{\varepsilon(n)}{n}$$

where b is a real number and the function ε satisfies

$$\lim_{n \rightarrow +\infty} \varepsilon(n) = 0.$$

1. Show that if $b < 1$, then the series $\sum x_n$ is divergent.
2. Show that if $b > 1$, then the series $\sum x_n$ is convergent.
3. What happens to $\sum x_n$ if $b = 1$?

is obtained by the following code (the text has been cut to underscore the structure of the code):

```
\begin{Exercise}[title={Duhamel's Rule}]
  Assume...
  \Question Show that if $b < 1$...
  \Question Show that if $b > 1$...
  \Question What happens to if $b=1$?
\end{Exercise}
```

Up to three level of question are available, and a part level (between exercise and question) is implemented:

```
\begin{Exercise}[title={Example}]
  Assume...
  \ExePart
  \Question
    \subQuestion Show that...
    \subQuestion In this question...
      \subsubQuestion Show that...
      \subsubQuestion Conclude...
    \subQuestion Conclude.
  \Question Show that if $b > 1$...
  \ExePart
  \Question What happens to if $b=1$?
\end{Exercise}
```

The commands to typeset question, sub-question and sub-sub-question are `Question`, `subQuestion`, and `subsubQuestion`. The exercise is split in parts with the command `ExePart`.

The environment `Exercise` can be stared (no number is typeset). The options of these commands are described in section 3. The layout of exercises can be customised in many way: see section 4.

It is common to have a long list of exercise to typeset, and the usage of the `Exercise` environment could be cumbersome. Another environment is available: the `ExerciseList` environment.

Ex. 2 — Discuss the convergence or divergence of $[1 + \sin(\frac{1}{an})]^{bn}$ where a and b are two parameters.

Ex. 3 — Discuss the convergence or divergence of $n^{\frac{(-1)^n}{n}} - 1$.

Ex. — Discuss the convergence or divergence of $\frac{(-1)^n}{n+(-1)^n}$.

Answer (ex. 2) — $\lim_{n \rightarrow +\infty} \left[1 + \sin \left(\frac{1}{an} \right) \right]^{bn} = e^{\frac{b}{a}}$

```
\begin{ExerciseList}
  \Exercise[label={ex:two}] Discuss...
  \Exercise Discuss...
  \Exercise* Discuss...
  \Answer[ref={ex:two}] $...$
\end{ExerciseList}
```

This example show two new commands: `\Exercise*` (for an exercise without number) and `\Answer`. These commands are explained in detail later in this document.

Of course, the `\Question`, `\subQuestion`, and `\subsubQuestion` hierarchy is also available in `ExerciseList`:

```
\begin{ExerciseList}
  \Exercise Discuss...
  \Exercise Let \$u$...
  \Question ...
    \subQuestion ...
    \Question
  \Exercise What...
\end{ExerciseList}
```

2 Options of the package

Here we list the options of the package `exercise.sty`:

`noexercise` hide all the exercises of a document.

`noanswer` hide all the answers of a document. The default behaviour is to show both the exercises and the answers.

`exerciseonly` is a synonym of `noanswer`.

`answeronly` is a synonym of `noexercise`.

`nothing` hide answers and exercises (synonym of `noanswer` and `noexercise`).

`answerdelayed` save the answers instead of typeset them. The answers can be included later in the document with the command `\shipoutAnswer`. More precisely, the answers are stored in a vertical box. When `\shipoutAnswer` is encountered, this box is emptied and its contents is placed in the main vertical list. The answers defined later are placed in this emptied vertical box. In this way, you can have many group of answers in the same document.

`exercisedelayed` saves the exercises instead of typeset them. The exercises can be included later with the command `\shipoutExercise`.

`lastexercise` if no references is given for an answer, then the answer is supposed to refer to the last exercise (see section 3.1).

3 Commands

3.1 Exercises and answers

```
\begin{Exercise} [<key val list>] ... \end{Exercise}
\begin{Exercise*} [<key val list>] ... \end{Exercise*}
```

`Exercise` The `Exercise` environment is used to typeset just one exercise. We use the `Exercise*` keyval package to give different informations about an exercise.

```

label={string}
title={string}
difficulty={number}
origin={string}
name={string}
counter={counter}
number={string}

```

All these keys define commands that will be available later to typeset the exercise. They are all optional.

label The label of the exercise. This label can be used later in cross-reference, or to link an answer to this exercise.

title The title of the exercise. It will be available later with the command `\ExerciseTitle`.

difficulty The difficulty of the exercise (a number). It will be available later with the counter `\ExerciseDifficulty`.

origin The origin of the exercise. It will be available later with the command `\ExerciseOrigin`.

name In document, exercises can have multiple denomination, like problem, exam, or even question. This key allows to change the denomination.

counter Use the given counter to number this exercise. Here, `{<counter>}` must be a pre-defined counter.

number Use the given number for the exercise. In fact, this number is a string, so you can number the exercise with letters.

As an example, with the default definitions, the following code:

```

\begin{Exercise}[title=Euler's constant, difficulty=2,
                origin=P.Paelw]
\end{Exercise}

```

will give

** Exercise 4 — Euler's constant (P.Paelw)

Problem It is possible to define different type of exercise. For example, you can define a **Problem** environment with the two lines:

```

\newcounter{Problem}
\newenvironment{Problem}{\begin{Exercise}[name=Problem,
                                         counter=Problem]}
{\end{Exercise}}

```

Anyway, all type of exercise will have the same layout in the document.

```
\begin{Answer} [<key val list>] ... \end{Answer}
```

Answer The **Answer** environment is used to typeset the answer of an exercise. To determine which the exercise this answer is attributed to, you can use the two following keys.

```
ref={<string>}  
number={<string>}
```

This is the description of these keys:

ref a L^AT_EX reference. *Must* correspond to the **label** key of an exercise.

number if the answer refers to an exercise in another document, you can set the number of the exercise with this key. It is in fact a string.

If the package is loaded with the option **lastexercise** and if no **ref** and no **number** key is given, then the last exercise is taken as a reference for the answer.

If no **ref** and no **number** key is given and the option **lastexercise** is not activated, a Package Warning is displayed.

```
\begin{ExerciseList}  
  \Exercise [<key val list>]  
  \Answer [<key val list>]  
\end{ExerciseList}
```

ExerciseList The **ExerciseList** environment is a convenience to typeset a list of small exercises. In **ExerciseList**, everything between two **\Exercise** or **\Answer** tags is interpreted as the body of an exercise (or an answer).

\Exercise The command **\Exercise** inside **ExerciseList** accepts the same keys than the **Exercise** environment. The command **\Answer** inside **ExerciseList** accepts the same keys than the **Answer** environment and behaves in the same way.

3.2 Parts and questions

```
\ExePart [<key val list>]  
\ExePart* [<key val list>]
```

\ExePart It is common to split large exercise in parts: it is the purpose of the **\ExePart** command. The keys **title**, **name** and **difficulty** are available for this command. For example, a non-numbered preliminary part is obtained with

```
\ExePart*[name={Preliminary}]
```

```
\Question[⟨key val list⟩]
\subQuestion[⟨key val list⟩]
\subsubQuestion[⟨key val list⟩]
```

`\Question` These three commands define the hierarchy of questions. A `\subsubQuestion` cannot be preceded by a `\Question` or a `\begin{Exercise}`. A `\subQuestion` cannot be preceded by a `\begin{Exercise}`. If one of these cases is detected, a Package Error is displayed.

Two keys are available for these commands: `title` and `difficulty`.

```
\ExeText
```

`\ExeText` The text following this command has the same status that the first indications of the exercise. So, the next level of the hierarchy must be a `\ExePart` or a `\Question`.

3.3 Extra stuff

`\marker` The difficulty of an exercise is represented by a certain amount of stars. The command `\marker` is used to typeset the difficulty of an exercise.

```
\marker<symbol><counter>
```

displays `<symbol>` repeated `<counter>` times. For example `\marker*2` gives **, and `\marker+{14}` gives ++++++++

By default, the difficulty is symbolized by star. You can customise this by redefining the command `\DifficultyMarker`.

4 Customisation

4.1 Internationalisation

```
\ExerciseName
\ExerciseListName
\AnswerName
\AnswerListName
\ExePartName
```

`\ExerciseName` These commands store various hard-wired string. `\ExerciseListName` is used in the `ExerciseList` environment: it is possibly an abbreviation of the word “Exercise”.

`\AnswerListName` `Exercise.sty` automatically detects the usage of `babel` and translate these terms in the language loaded... if I (the author) know the translation! As my skills in foreign language are quite weak, only English and French are currently supported.

If you sent me the translations in your language, I will be happy to add them in the package. Anyway, you can redefine these commands (with a `\renewcommand`).

4.2 Layout

4.2.1 Exercises, answers and parts

For the layout of the exercises, two levels of customisation are available. First, you can customise the way the informations will be typeset, and then you can customise the way these pieces of informations are typeset together.

```
\ExerciseHeaderTitle  
\ExerciseHeaderDifficulty  
\ExerciseHeaderOrigin  
\ExerciseHeaderNB
```

\ExerciseHeaderTitle These commands are used to typeset the corresponding information:
\ExerciseHeaderDifficulty \ExerciseHeaderTitle corresponds to the title key,
\ExerciseHeaderOrigin \ExerciseHeaderDifficulty to the difficulty key, \ExerciseHeaderOrigin
\ExerciseHeaderNB to the origin key and \ExerciseHeaderNB to the number of the exercise.

In these commands, you specify the fonts to use, the space around the information, some symbols (like dash or dot) you want to put here, and so on. If the key is not present in the definition of the exercise, then the corresponding part of the header will be emptied by the package.

For example the default definition of \ExerciseHeaderTitle is

```
\newcommand{\ExerciseHeaderTitle}{\quad--\quad\ExerciseTitle}
```

If an exercise has a title, then this title will be displayed preceded by an emdash (as you can see in exercise 1 of this document). If an exercise doesn't have a title, then this command is set to nothing (precisely to {}) during the exercise.

These commands can be redefined with a \renewcommand. You don't have to worry about the "undefined" mechanism: the package manages that by itself.

```
\ExerciseHeader  
\ExerciseListHeader
```

\ExerciseHeader When the layout of all the elements has been fixed, they are collected in the
\ExerciseListHeader command (or in \ExerciseListHeader). Here, you specify the way the different elements are mixed together.

The default definition of \ExerciseHeader is

```
\newcommand{\ExerciseHeader}{\centerline{\textbf{\large  
  \ExerciseName\ExerciseHeaderNB\ExerciseHeaderTitle  
  \ExerciseHeaderOrigin\medskip}}}
```

which displays all the informations in a centered line, using a large bold default font.

```
\AnswerHeader  
\AnswerListHeader
```

\AnswerHeader The same mechanism is implemented for the answers. \AnswerHeader and
\AnswerListHeader

`\AnswerListHeader` specifies the way the header of answers are typeset. In the definition of these commands, you can use freely the informations of the related exercise. For example, this is the default definition of `\AnswerHeader`:

```
\newcommand{\AnswerHeader}{\medskip\centerline{\textbf{Answer of \ExerciseName\ \ExerciseHeaderNB}}\smallskip}
```

<code>\ExePartHeaderTitle</code>
<code>\ExePartHeaderDifficulty</code>
<code>\ExePartHeaderNB</code>
<code>\ExePartHeader</code>
<code>\ExePartListHeader</code>

`\ExePartHeaderTitle` The same kind of customisation is available for the `\ExePart` command:
`\ExePartHeaderDifficulty` `\ExePartHeaderTitle`, `\ExePartHeaderDifficulty` and `\ExePartHeaderNB`
`\ExePartHeaderNB` control the way the title (`\ExePartTitle`), the difficulty (`\ExePartdifficulty`)
`\ExePartHeader` and the number (`\theExePart`) of the part are displayed.
`\ExePartListHeader` These pieces are collected in the command `\ExePartHeader` or
`\ExePartListHeader`.

4.2.2 Questions, sub-questions and sub-sub-questions

The layout of the questions is a little more rigid. Somehow, it can be customised.

<code>\QuestionHeaderTitle</code>
<code>\QuestionHeaderDifficulty</code>
<code>\QuestionHeaderNB</code>

`\QuestionHeaderTitle` These commands plays the same role that the corresponding command relating
`\QuestionHeaderDifficulty` to exercises. But here, no `\QuestionHeader` is defined.
`\QuestionHeaderNB` The `subQuestion` and `subsubQuestion` versions of these commands are also
`\subQuestionHeaderTitle` defined.
`\subQuestionHeaderDifficulty` All of these commands can be changed using `\renewcommand`.
`\subQuestionHeaderNB`

<code>\Exesep</code>	<code>\Exetopsep</code>	<code>\Exeparsep</code>	<code>\Exeparttopsep</code>
<code>\Exeleftmargin</code>	<code>\Exerightmargin</code>	<code>\Exelabelwidth</code>	<code>\Exelabelsep</code>

`Exesep` The `ExerciseList` environment is nothing more than a `list` environment. All
`Exetopsep` the parameters of L^AT_EX's lists are available. Please consult your favourite source
`Exeparsep` of information to have the exact definitions of these lengths.
`Exeparttopsep`
`Exeleftmargin`
`Exerightmargin`
`Exelabelsep`

\QuestionBefore	\QuestionIndent
\subQuestionBefore	\subQuestionIndent
\subsubQuestionBefore	\subsubQuestionIndent

QuestionBefore \QuestionIndent
 QuestionIndent \subQuestionIndent
 subQuestionBefore \subsubQuestionIndent
 subQuestionIndent
 subsubQuestionBefore
 subsubQuestionIndent

\renewcounter Here, \QuestionBefore is the vertical space above \Question, and \QuestionIndent it the horizontal distance added to the margin in question. Same thing for \subQuestion and \subsubQuestion.

4.4 The \renewcounter command

In a document, you will probably want to customise the way the **Exercise** counter will reseted. Strangely, it is impossible to redefined counter with L^AT_EX. There is no equivalent of the \renewcommand command for the counters.

We provide such an equivalent with the command \renewcounter.

\newcounter{\langle foo \rangle}[\langle counter \rangle]

The \renewcounter command defines a new counter named **foo**. The counter is initialized to zero.

The optional argument [\langle counter \rangle] causes the counter **foo** to be reset whenever the counter named in the optional argument is incremented.

If the counter **foo** was not previously defined, an L^AT_EX error occurs.

5 Known problems

The commands \Question, \subQuestion, etc. are heavily based on **list** environment. These lists are hidden (I know it's bad!) to simplify the syntax of the source file (I think it's nice!).

In fact, every \Question is like the beginning of an environment, which is closed at the next \Question (the exact mechanism is a little bit more complicated).

Consequently it's dangerous to put questions inside environment. The following code will lead to an error:

```
\begin{Exercise}
  \begin{multicols}{2}
    \Question ...
    \Question ...
  \end{multicols}
\end{Exercise}
```

Of course, you can put entire exercise inside other environment (like **minipage**). The following code will work:

```
\begin{multicols}{2}
  \begin{Exercise}
    \Question ...
    \Question ...
  \end{Exercise}
\end{multicols}
```

```
\EndCurrentQuestion
\EndCurrentsubQuestion
\EndCurrentsubsubQuestion
```

\EndCurrentQuestion If you really need to put some questions inside environment, you must use
 \EndCurrentsubQuestion the command `\EndCurrentQuestion` just before ending the environment. This
 \EndCurrentsubsubQuestion command ends the question's "environment". So, this code will work:

```
\begin{Exercise}
  \begin{multicols}{2}
    \Question ...
    \Question ...
    \EndCurrentQuestion
  \end{multicols}
\end{Exercise}
```

In `ExerciseList` environment, the command `\Exercise` shouldn't be followed by an empty line.

Change History

v1.0	proved index.	1
General: Initial version	1	v1.1
v1.01	General: Added the 'renewcounter' command.	9
General: Many typos corrected, im-		

6 Implementation

6.1 Package options

This part deals with the package options. Nothing more than an affair of boolean.

```
1 \newif\if@AnswerOutput      \@AnswerOutputtrue
2 \newif\if@AnswerDelay       \@AnswerDelayfalse
3 \newif\if@ExerciseOutput   \@ExerciseOutputtrue
4 \newif\if@ExerciseDelay    \@ExerciseDelayfalse
5 \newif\if@AswLastExe      \@AswLastExefalse
6
7 \DeclareOption{noanswer}    {\@AnswerOutputfalse}
8 \DeclareOption{answeronly}  {\@ExerciseOutputfalse}
9 \DeclareOption{noexercise}  {\@ExerciseOutputfalse}
10 \DeclareOption{exerciseonly}{\@AnswerOutputfalse}
11 \DeclareOption{outputnothing}{\@ExerciseOutputfalse\@AnswerOutputfalse}
12 \DeclareOption{exercisedelayed}{\@ExerciseDelaytrue}
13 \DeclareOption{answergedelayed}{\@AnswerDelaytrue}
14 \DeclareOption{lastexercise} {\@AswLastExetrue}
```

The following option, which displays the exercise label in margin, is not implemented yet.

```

15 \newif\if@ShowLabel           \c@ShowLabelfalse
16 \DeclareOption{showlabel}{\c@ShowLabeltrue}
17
18 \ProcessOptions
The only required package are keyval and ifthen.
19 \RequirePackage{keyval, ifthen}

```

6.2 Customisation

6.2.1 Internationalisation

```

6.4 The `\renewcounter` command

This commands is the equivalent of the well-known `\renewcommand`, but for counter. It allows you to redefine the `Exercise` counter, in order to reset it at each chapter (for example).

```

617 \def\renewcounter#1{%
618   \@ifundefined{c@#1}%
619     {\@latex@error{counter #1 undefined}\@ehc}%
620   \relax
621   \let\@ifdefinable\rc@ifdefinable
622   \@ifnextchar[\@newctr{#1}{}]

```

Index

For entries in type-writer font, numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in roman refer to the code lines where the entry is used.
