

Printing booklets with LaTeX*

Peter Wilson[†]
The Herries Press

2005/06/01

Abstract

The `booklet` package provides some aid in printing simple booklets or signatures for longer books.

1 Introduction

In normal usage the `booklet` package subverts LaTeX into putting pairs of pages onto a single page. For example, the contents of pairs of A4 portrait pages can be rotated and printed as two A5 portrait pages side by side on an A4 landscape page.

In 1993 Timothy Van Zandt wrote the `2up` generic macros for printing more than one page on a physical sheet [Zan93]; his original code and documentation

*This file (`booklet.dtx`) has version number v0.7a, last revised 2005/06/01.

[†]herries dot press at earthlink dot net

is in appendices A and B. The **booklet** package is a poorman's version of some of the 2up macros specifically for (pdf)LaTeX.

The 2up and **booklet** packages cannot be used simultaneously in one document.

This manual is typeset according to the conventions of the L^AT_EX DOCUMENT STRIP utility which enables the automatic extraction of the L^AT_EX macro source files [GMS94].

Section 2 describes the usage of the **booklet** package and commented source code is in Section 3. Timothy Van Zandt's original macros and documentation are supplied in the appendices.

2 The **booklet** package

The code provided by the **booklet** package is meant to help with some aspects of booklet printing.

Basically, the pages of documents processed with the **booklet** package will be reordered and scaled so that they can be printed as four pages per physical sheet of paper, two pages per side of the sheet. The default expectation is that the original document is in a portrait orientation and the pages are printed rotated onto a landscape sheet. Folding the sheet in half will produce a half-sized document, again with portrait orientation.

Professionally printed books have many pages printed per sheet of (large) paper, which is then folded and cut where necessary to produce a *signature* of several smaller sheets. Folding a sheet in half produces a one sheet *folio* signature with four pages. Folding it in half again and cutting along the original fold gives a two sheet *quarto* signature with eight pages. Folding in half again, results in a four sheet *octavo* signature with 16 pages, and so on through *16mo*, *32mo*, to *64mo* with six folds and 128 pages. *Octavo* is the most popular of these.

Other folds can produce other signatures. For example a *sesto*, obtained by folding in half and then folding in thirds, is a three sheet signature with 12 pages.

The main differences between the 2up macros and the **booklet** package are:

- 2up is generic but **booklet** can only be used with (pdf)LaTeX.
- 2up can be used for more than booklets
- **booklet** adds the notion of signatures and reduces the need for \boxes.
- **booklet** adds means of automatically controlling portrait/landscape printing.

2.1 Options

When the **noprint** option is used the package is essentially vacuous. That is, it behaves as though it had not been used at all, with the exception that LaTeX will not hiccup at any of the package commands that may be used in the document; these commands will also do nothing.

The **print** option must be used if you want the package to work as advertised. The reasons for the **print** and **noprint** options are explained later in Section 2.3.

The **booklet** package can also take one option from each of two groups.

The first group of options specifies how many pages there should be to a hypothetical signature. The options are: **four**, **eight**, **sixteen**, and **thirtytwo**. TeX has to hold all the pages for a signature before it outputs any of them, and TeX is memory limited.

If you have a duplex printer you can print out the document double-sided and then just fold the sheets forming each signature ready for binding. If you don't have a duplex printer, then the sheets can be photocopied (1-to-2 sided) ready for folding.

The second group of options are for selecting one of the package's predefined layouts. These options include:

twoparticle — for portrait pages with wide margins (similar to those in the standard LaTeX article, book and report classes) and no marginal notes, to go on landscape sheets.

largetypeblock — for portrait pages with a larger (wider and/or longer) typeblock and/or marginal notes, to go on landscape sheets.

1to1 — for portrait pages where the original is designed to fit on half-sized paper, to go on landscape sheets.

landscape — for landscape pages to go onto portrait sheets. Pairs of original landscape pages will be printed at the top and bottom of a portrait page. This option is called automatically if the **landscape** option is used for the document class.

The default options are **noprint**, **twoparticle** and **thirtytwo**.

2.2 Commands

The *source* is the document as it would be normally typeset by LaTeX (i.e., without using the **booklet** package).

The *target* is the desired document as it should be printed using the **booklet** package.

\source The command `\source{<mag>}{<width>}{<height>}` specifies the source sheets, where *width* and *height* are the width and height for the pages of the original document (the document that LaTeX would process without the **booklet** package). The *<mag>* argument is the magnification factor.

The default definition of `\source` is:

```
\source{\magstep0}{\paperwidth}{\paperheight}
which corresponds to a full size default page.
```

\target The command `\target{<mag>}{<width>}{<height>}` specifies the target sheets, where *width* and *height* are the width and height for the sheets that will be used for printing with the package. For example, `\target{...}{11in}{8.5in}` would be typical for a (portrait letterpaper) source being put onto a (landscape) letterpaper target.

\magstepN The package puts two pages onto a single sheet. It often happens that in order to do this the natural size of the text pages has to be changed, via the

$\langle mag \rangle$ argument noted above. The macro `\magstepminusN`, where $0 \leq N \leq 5$ is a shrinkage factor; similarly, `\magstepN` specifies a magnification factor. For example, the default `\target` is specified as:

```
\target{\magstepminus1}{\paperheight}{\paperwidth}
```

whereas the target for the `largetypeblock` option is:

```
\target{\magstepminus2}{\paperheight}{\paperwidth}
```

which shrinks the original pages more than the default `\target` does.

The booklet package uses the `\source` and `\target` specifications to decide on how to scale and position the original full size source pages onto half of a target sheet.

Normally there is no need to change the default `\source` but it may be useful sometimes to change the `\target`. For example, if the text on source letterpages is very wide it could be useful to print on legal paper instead. In this case `\target` can be defined as:

```
\target{\magstepminus2}{14in}{8.5in}
```

If none of the signature options are suitable, then `\pagespersignature{\langle num \rangle}` may be used to specify $\langle num \rangle$ pages per signature. For example, if you wanted a *sext*o signature then use `\pagespersignature{12}`.

The command `\ifprintoption` is set TRUE if the `print` option is used otherwise it is set FALSE.

If you are using LaTeX to generate a `.dvi` file the `\setdvipstargetpages` macro sets up the correct target page sizes in the `.dvi` file assuming that subsequent processing will be via a program that understands `dvisps` `\special` commands.

If you are using pdfLaTeX to generate a `.pdf` file the `\setpdftargetpages` macro sets up the correct target page sizes for pdfLaTeX.

A line may be drawn between the output text pages. The length of the line is `\pagesepwidth` (default 6.5in), and line starts a distance `\pagesepoffset` from the bottom (side) of the printed sheet (default 1in). The line thickness is specified by the length `\pagesepwidth`, which is initially defined to be 0pt (i.e., the line is normally invisible). To see a dividing line use `\setlength` to change the value of `\pagesepwidth`; in LaTeX ruled lines normally have a thickness of 0.4pt.

The command `\twoupclearpage` outputs the current target page (like LaTeX's `\newpage`). The command `\twoupemptypage` inserts a completely empty page into the target.

The command `\ifuselandscape` is set TRUE if the `landscape` option is used otherwise it is set FALSE.

The macro `\checkforlandscape` evaluates the value of `\ifprintoption` and the current value of `\ifuselandscape` and sets `\ifuselandscape` to TRUE if the document requires landscape printing (when either both the `landscape` and `noprint` options are used, or when just the `print` option is called for), or to FALSE if the document should be printed in the normal portrait orientation (when either both the `landscape` and `print` options are used, or when just the `noprint` option is used without `landscape`).

Note that as `\checkforlandscape` may change the value of `\ifuselandscape`, the command is only guaranteed when `\ifuselandscape` accurately indicates the

```
\pagespersignature

\ifprintoption

\setdvipstargetpages

\setpdftargetpages

\pagesepwidth
\pageseplength
\pagesepoffset

\twoupclearpage
\twoupemptypage

\ifuselandscape
\ifprintoption
\checkforlandscape
```

presence or absence of the `landscape` option.

In version 0.7 of the package the macro `\setdvipstargetpages` was introduced and the macro `\setpdftargetpages` was modified with the result that `\checkforlandscape` was effectively no longer needed. It is left to maintain upward compatibility for older documents.

2.3 Usage

You use the `booklet` package just like any other package:

```
\usepackage[<options>]{booklet}
```

but some other things need taking care of as well.

If you are making any changes to the values of `\paperwidth` or `\paperheight`, say through the `geometry` package or the `memoir` class, then the `booklet` package must be called *after* those changes have been made. In this case you may have to specify a different `\source` than usual, but I think that this is probably unlikely.

`\special`

Under normal circumstances printing should be done onto landscape oriented paper instead of the usual portrait orientation. If you are using the `dvips` program for transformation from the `.dvi` to a `.ps` file, then you can use the command `\special{landscape}` in the preamble so that the output is organised for landscape. Other drivers may support similar commands, or command line options for accomplishing this.

For example, it may happen that if you use `ghostview` (or `gsview`) to look at `dvips` PostScript output of the final printing that the text appears upside down. Putting:

```
\special{!TeXDict begin /landplus90{true}store end}
just before the \begin{document} may cure this.
```

I use a LaserJet printer with a duplex printing capability (i.e., printing can be done on both sides of a sheet in one pass). When printing in duplex mode I also found that it was very convenient to change the binding from the long to the short side of the paper; the sheets were then all set for folding. Using `dvips` and the 5SiMx LaserJet I found that the following commands in the preamble let me change the printer settings from the document.

```
\special{!TeXDict begin <</Duplex true>> setpagedevice end} % duplex
\special{!TeXDict begin <</Tumble true>> setpagedevice end} % short binding
```

How these would fare with another printer or program, I have no idea. The CTAN subdirectory `/dviware/dvipsconfig` contains a set of files for performing the above operations, and more, as command line options for `dvips`.

If you can only do simplex printing (one side only), then when photocopying from one-sided to two-sided, alternate printed pages need to be rotated 180 degrees before being fed into the copier.

The following physical analogy of how the package works with portrait pages may help in achieving results that you want.

- Write the original text on portrait oriented transparent material (e.g., viewfoils) which is the same size as that specified by the `\source` macro. Mark the centre — the point where the diagonals intersect — of each original page.
- Take a sheet of paper the same size as that specified by the `\target` macro and in landscape orientation. Mentally divide this in half by a vertical line and then mark the centre points of the two (left and right) halves.
- Take an even numbered original sheet, portrait orientation, and place it on top of the landscape oriented target sheet with its centre point coincident with the left half centre point. Do the same with an odd numbered original sheet except that its centre is coincident with the right half centre point.
- Take the assembly to a photocopier and make a copy onto a target sized sheet. This is the final result.

The analogy for landscape originals is similar with the obvious changes in the orientations.

Note that the analogy does not include any scaling. If the size of the target is relatively small then the texts on the original sheets may overlap or extend outside the physical target sheet. If the target is relatively large then there may be too much white space around the texts. The $\langle mag \rangle$ arguments to the `\source` and `\target` macros are provided to adjust the source/target text sizes. Scaling does not affect the positions of the texts.

If you are planning to produce a booklet in the first place, then design the initial page layout as though it would be printed on half-sized paper. This will produce a better end result as no scaling will be necessary. The `1to1` option is provided for just this case.

If the original pages look too crowded after printing, you can specify another `\target` with a larger shrink factor (e.g., `\magstepminus3` instead of `\magstepminus2`). Conversely, too much white space can be countered by decreasing the shrink factor (e.g., `\magstepminus1` instead of `\magstepminus2`).

The following are the default settings of `\source` and `\target` (the source and target sheets are the same size) for the different layout options.

`twouparticle:`

```
\source{\magstep0}{\paperwidth}{\paperheight}
\target{\magstepminus1}{\paperheight}{\paperwidth}
```

`largertypeblock:`

```
\source{\magstep0}{\paperwidth}{\paperheight}
\target{\magstepminus2}{\paperheight}{\paperwidth}
```

`1to1:`

```
\source{\magstep0}{\paperwidth}{\paperheight}
\target{\magstep0}{\paperheight}{\paperwidth}
```

If the original is not planned to be produced as a booklet, then obtaining respectable looking full size and booklet results may require some trial and error in determining good values for magnifications and/or target paper sizes. The original page margins may also need changing for the booklet output.

LaTeX is not very happy if it is forced to save some pages instead of outputting each one as it is finished. It shows its displeasure by messing up any internal references in the document, for example a Table of Contents or an Index. To counter this, run LaTeX on the document *without* the `print` package option until all references have stabilised. Then put the command `\nofiles` in the preamble, use the `print` option, and run LaTeX a final time before printing. (The `\nofiles` command stops LaTeX from generating new `.aux`, `.toc` files, etc., but it will still use any old versions).

The following gives an indication of how the relevant portion of a preamble may look.

```
% possibly change default \paperwidth and/or \paperheight
% \usepackage[noprint,...]{booklet}           % use this
% \usepackage[...]{booklet}                   % or this for initial runs
% \usepackage[print, ...]{booklet} \nofiles % use this for final run
% perhaps change \target
\ifpdf                         % from the ifpdf package
  \pdfoutput = 1                 % generate pdf output
  \setpdftargetpages           % set output page size
\else
  \setdvipstargetpages        % use this for dvi output
\fi
...
...
```

It is safer to use the package without the `print` option for the initial runs rather than not using the package at all; doing it this way will stop LaTeX from complaining if you happened to have used any of the `booklet` commands in the document.

TeX allocates a new box for each page in the first signature and then these are reused for each subsequent signature. Large signatures may use up all available boxes in which case TeX will tell you. It is much more probable, though, that TeX will run out of memory before this happens.

Here is a real example of one booklet setup for typesetting a 68 page book. I used the `memoir` class but afterwards I'll point out how to do the equivalent with the `book` class.

```
\documentclass[letterpaper,11pt]{memoir}
% typeblock size of 5.5+ by 4 inches
\settypeblocksize{5.5in}{4in}{*}
\addtolength{\textheight}{\onelineskip}
\setlrmargins{2in}{*}{*}
\setulmargins{2.25in}{*}{*}
\checkandfixthelayout

% \usepackage[noprint]{booklet}
```

```
\usepackage[print,1to1]{booklet} \nofiles
\pagespersignature{16} % 16 pages per signature

\ifpdf
  \setpdftargetpages
\else
  \setdvipstargetpages
\fi
\ifprintoption % tweak dvi output only for final printing
  \special{!TeXDict begin /landplus90{true}store end}
  \special{!TeXDict begin <</Tumble true>> setpagedevice end}
\fi

\begin{document}
\pagestyle{empty}
% Want a blank sheet before the title page
\hbox{} \cleardoublepage
% half-title page here
\cleardoublepage

% title page here
\clearpage

% copyright page here
\cleardoublepage

\pagestyle{plain}
\pagenumbering{roman}
\tableofcontents*
\cleardoublepage
\pagenumbering{arabic}
\pagestyle{headings}

\chapter{First}
% and so on

% want some blank endpapers to get enough pages into
% the last signature for easy binding
\clearpage
\hbox{} \clearpage \hbox{} \cleardoublepage
\end{document}
```

Using the *book* class just involves changing how the page layout is specified:

```
\documentclass[letterpaper,11pt]{book}
% typeblock size of 5.5 by 4 inches
\setlength{\textheight}{419pt} \setlength{\textwidth}{289pt}
\setlength{\oddsidemargin}{72pt} \setlength{\evensidemargin}{108pt}
\setlength{\topmargin}{55.9pt} \setlength{\footskip}{27.5pt}
\setlength{\headheight}{14.6pt} \setlength{\headsep}{19.9pt}
```

```
% \usepackage[noprint]{booklet}
...
```

If you try and use a non-zero magnification with a document that has any ‘true’ lengths, for example the `amsbook` class, TeX itself will complain with an error message of the form:

```
!Incompatible magnification (833);
the previous value will be retained
```

Try forcing LaTeX to continue and check the output because you might be lucky and it looks alright.

Here is another example from a posting to `comp.text.tex` by Gordo in the thread *booklet problem*, 2005/05/26.

```
\documentclass[twoside,10pt]{article}
\setlength{\paperwidth}{5.5in}
\setlength{\paperheight}{8.5in}
\setlength{\topmargin}{-0.3in}
\setlength{\textheight}{6.9in}
\setlength{\oddsidemargin}{0.0in}
\setlength{\evensidemargin}{-0.5in}
\setlength{\textwidth}{4.0in}
\usepackage{makeidx}
%\usepackage[noprint,1to1]{booklet} % initial runs for ToC and index
\usepackage[noprint,1to1]{booklet} \nofiles % final printing run
\source{\magstep0}{5.5in}{8.5in}
\target{\magstep0}{11in}{8.5in}
\setpdftargetpages
\pagespersignature{120}
\makeindex
\begin{document}
\pagenumbering{roman}
\begin{titlepage} ... \end{titlepage} % the title
...
\newpage
\begin{titlepage} \mbox{} \end{titlepage} % back cover
\end{document}
```

As yet another example, you can produce this manual as a booklet. Change the first part of this file to read:

```
\documentclass[twoside]{ltxdoc}
\usepackage{url}
\usepackage{ifpdf}
\addtolength{\evensidemargin}{-0.75in}
% \usepackage[noprint]{booklet} % initial runs
\usepackage[print,largeypeblock]{booklet}\nofiles\pagespersignature{48} % final run
%\usepackage[draft=false,
```

```
% plainpages=false,
% pdfpagelabels,
% bookmarksnumbered,
% hyperindex=false
% ]{hyperref}
\ifpdf
  \setpdftargetpages
\else
  \setdvipstargetpages
\fi
\providecommand{\phantomsection}{}%
\makeatletter
  \c@mparswitchfalse
\makeatother
...

```

The `hyperref` package interferes with the `\setpdftargetpages` macro so it is commented out. The `largetypeblock` option is used otherwise the marginal notes can fall off the edges of the pages in the final printing; the `\evensidemargin` is also altered for the same reason. The value for `\pagespersignature` is to ensure that only a single signature is produced (you can decrease this if you are willing to bind multiple signatures).

The original source of the `2up` package is included at the end of this manual. It may provide some more insights into how to use the `booklet` package. Be careful, though, as the two packages differ in some significant details.

3 The package code

The package code essentially consists of modifications to the `2up` macros, which are given in section A. I could not have written the `booklet` package without Timothy Van Zandt's `2up` macros.

As much as possible I have tried to keep to the original `2up` macro names. However, the `2up` and `booklet` packages cannot be used in the same document.

The code is actually in two packages, `booklet.sty` which provides the commands that the user sees, and `bk1tpnrt.sty` which is used by `booklet.sty` to do all the hard work.

3.1 Preliminaries

Announce the name and version of the packages, which require L^AT_EX 2 _{ε} .

```
1 <*usc>
2 \NeedsTeXFormat{LaTeX2e}
3 \ProvidesPackage{booklet}[2005/03/23 v0.7 booklet printing]
4
5 </usc>
6 <*prnt>
```

```

7 \NeedsTeXFormat{LaTeX2e}
8 \ProvidesPackage{bklprnt}[2005/03/23 v0.7 support for booklet printing]
9
10 </prnt>

```

3.2 The main booklet code

The booklet package provides the user commands. Then, if the `print` option is used it calls the `bklprnt` package to do the work.

```
11 <*usc>
```

`\twoup@end` For the `print` and `noprint` options.

```

12 \newcommand*{\twoup@end}{\endinput}
13

```

`\pageseplength` Lengths for the dividing rule.

```

\pagesepwidth 14 \newdimen\pageseplength
\pagesepoffset 15 \newdimen\pagesepwidth
               16 \newdimen\pagesepoffset
               17

```

`\ifsidebyside` TRUE if pages are to be placed side-by-side on the sheet. I have changed the original `\if@sidebyside` to `\ifsidebyside` so that a user can call it easily. I don't don't implement the `\if@twosided`.

```

18 \newif\ifsidebyside
19   \sidebysidetrue
20

```

`\ifuselandscape` Booleans for some options and for if the final printing should be landscape.

```

\ifprintoption 21 \newif\ifuselandscape
                22 \uselandscapefalse
                23 \newif\ifprintoption
                24 \printoptionfalse
                25

```

`\c@signature` Counters for signature handling.

```

\c@sigcount 26 \newcounter{signature}
             27 \newcounter{sigcount}
             28 \setcounter{sigcount}{0}

```

`\pagespersignature` A user-level command for setting the number of pages wanted in a signature. I initialise these to 32.

```

29 \newcommand*{\pagespersignature}[1]{\setcounter{signature}{#1}}
30   \pagespersignature{32}
31

```

```

\magstepminus A useful extension of the \magstep macro.
32 \def\magstepminus#1{%
33   \ifcase#1 @m\or 833\or 694\or 579\or 482\or 401\fi\relax}
34

\target Vacuous versions of the user-level macros.
\source 35 \newcommand*{\target}[3]{}
\setpdftargetpages 36 \newcommand*{\source}[3]{}
\setdvipstargetpages 37 \newcommand*{\setpdftargetpages}(){}
38 \newcommand*{\setdvipstargetpages}(){}
39

\targettopbottom Vacuous version of the user command.
40 \newcommand*{\targettopbottom}){}
41

\twoupemptypage vacuous versions of the user commands.
\twoupclearpage 42 \newcommand*{\twoupemptypage}){}
43 \newcommand*{\twoupclearpage}){}
44

\checkforlandscape Sets the value of \ifuselandscape to (\ifuselandscape XOR \ifprintoption).
45 \newcommand*{\checkforlandscape}{%
46   \ifx\ifuselandscape\ifprintoption
47     \uselandscapefalse\else\uselandscapetrue\fi}
48

```

Now declare the `print`, `noprint` and `landscape` options, prepare to pass any other options to `bklprnt`, and execute the options.

```

49 \DeclareOption{print}{\printoptiontrue\def\twoup@end{}}
50 \DeclareOption{noprint}{\printoptionfalse\def\twoup@end{\endinput}}
51 \DeclareOption{landscape}{\uselandscapetrue}
52 \DeclareOption*{\PassOptionsToPackage{\CurrentOption}{bklprnt}}
53 \ProcessOptions\relax
54 \ifuselandscape
55   \PassOptionsToPackage{landscape}{bklprnt}
56 \fi
57

```

Now call `\twoup@end`, which is either `\endinput` or vacuous, after which the `bklprnt` package is called (if `\twoup@end` was vacuous).

```

58 \twoup@end
59
60 \RequirePackage{bklprnt}
61

```

The end of this package.

```

62 </usc>

```

3.3 The main **bkltprnt** code

63 *(*prnt)*

```
\@targetwidth Parameter registers.
\@targetheight 64 \newdimen\@targetwidth
\@sourcewidth 65 \newdimen\@targetheight
\@sourceheight 66 \newdimen\@sourcewidth
                67 \newdimen\@sourceheight
                68

\if@leftpage Registers used by output routine.
\@leftpage 69 \newif\if@leftpage
\@rightpage 70 \@leftpagetrue
\@physicalpage 71 \newbox\@leftpage
                72 \newbox\@rightpage
                73 \newcount\@physicalpage
                74
```

Since pages are both stored and shipped out half as often:

```
75 \multiply\maxdeadcycles by 40\relax
76
```

```
\bookletpage Registers used only for booklet layout. These are specified directly as this is the
\leftpagenumber only layout.
\rightpagenumber 77 \newcount\bookletpage
                78 \bookletpage=0
                79 \newcount\leftpagenumber
                80 \newcount\rightpagenumber
                81
```

\twoupp@geboxes I have added this macro so that only the boxes required for a signature are created.
The original 2up code creates a new box for each output page.

```
82 \newcommand*{\twoupp@geboxes}{%
83   \advance\bookletpage\@ne
84   \expandafter\newbox\csname bookletbox\the\bookletpage\endcsname
85   \ifnum \bookletpage < \c@signature
86     \twoupp@geboxes
87   \fi}
88 \AtBeginDocument{\twoupp@geboxes\bookletpage=\z@}
89
```

```
\target \@targetwidth and \@targetheight are set to the unmagnified dimensions of
\inv@targetmag the target page. \inv@targetmag is the inverse of the target magnification.
90 {\catcode`\p=12\catcode`\t=12\gdef\@inv@@mag#1pt#2{\def#2{#1}}}
91 \def\target#1#2#3{%
92   \mag #1\relax

94   \divide\@targetwidth by #1\relax
```

```

95  \expandafter\@@inv@@mag\the\@targetwidth\inv@targetmag
96  \@targetwidth=#2\relax
97  \@targetwidth=\inv@targetmag\@targetwidth
98  \@targetheight=#3\relax
99  \@targetheight=\inv@targetmag\@targetheight}
100

```

\source Like \target, but for the source:

```

101 \def\source#1#2#3{%
102   \c@sourcewidth=1000pt
103   \divide\c@sourcewidth by #1\relax
104   \expandafter\@@inv@@mag\the\c@sourcewidth\inv@sourcemag
105   \c@sourcewidth=#2\relax
106   \c@sourcewidth=\inv@sourcemag\c@sourcewidth
107   \c@sourceheight=#3\relax
108   \c@sourceheight=\inv@sourcemag\c@sourceheight}
109

```

\setpdftargetpages This macro specifies the size of the target page for pdfLaTeX. It ensures that memoir's version (\fixpdflayout) does nothing.

```

110 \renewcommand*{\setpdftargetpages}{%
111   \ifprintoption
112     \setlength{\pdfpageheight}{\c@targetheight}%
113     \setlength{\pdfpagewidth}{\c@targetwidth}%
114     \let\fixpdflayout\relax
115   \fi}

```

\setdvipstargetpages This macro specifies the size of the target page fow when dvips is used. It ensures that memoir's version (\fixdvipslayout) does nothing.

```

116 \renewcommand*{\setdvipstargetpages}{%
117   \ifprintoption
118     \AtBeginDvi{\special{papersize=\the\c@targetwidth,\the\c@targetheight}}%
119     \let\fixdvipslayout\relax
120   \fi}
121

```

\targetBooklet I only provide the original 2up Booklet, not booklet. For the booklet package the \ship@@@leftpage Booklet code can be processed immediately. The code in this chunk is equivalent \ship@@@rightpage to the original \target@Booklet.

```

122 \def\targetBooklet{%
123   \def\ship@@@leftpage{\save@booklet\@leftpage}%
124   \def\ship@@@rightpage{\save@booklet\@rightpage}%
125   \c@leftpagefalse}
126 \targetBooklet
127

```

\targettopbottom I have renamed the original \target@topbottom to \targettopbottom

```

128 \def\targettopbottom{%
129   \def\make@@halfpage{\make@@halftopbottom}%

```

```

130 \def\make@fullpage{\make@fulltopbottom}%
131 \sidebysidefalse}
132

```

Specify the options. There are new ones for signature sizes, and some of the original 2up source/targets are now treated as options.

```

133 \DeclareOption{four}{\setcounter{signature}{4}}
134 \DeclareOption{eight}{\setcounter{signature}{8}}
135 \DeclareOption{sixteen}{\setcounter{signature}{16}}
136 \DeclareOption{thirtytwo}{\setcounter{signature}{32}}
137 \DeclareOption{twouparticle}{\twouparticle}
138 \DeclareOption{landscape}{\twoplaintext}
139 \DeclareOption{largetypeblock}{\twoplain}
140 \DeclareOption{1to1}{\twounonetooone}
141

```

\shipout TeX's `\shipout` primitive is saved as `\&normal@shipout`, and then `\shipout` is defined to save each page to `\@leftpage` or `\@rightpage` and to print out every two. There is no twosided layout in this version.

```

142 \expandafter\let\csname &normal@shipout\endcsname\shipout
143 \def\shipout{%
144   \if@leftpage
145     \global\@leftpagefalse
146     \def\next{\afterassignment\ship@leftpage\global\setbox\@leftpage=}%
147   \else
148     \global\@leftpagetrue
149     \def\next{\afterassignment\ship@rightpage\global\setbox\@rightpage=}%
150   \fi
151   \next}
152

```

\ship@leftpage The job of `\ship@leftpage` and `\ship@rightpage` is to invoke `\ship@@leftpage` or `\ship@@rightpage` at the right time. `\shipout` is followed either:

1. by an `\hbox`, `\vbox` or `\vtop`, in which case `\ship@leftpage` is invoked after the opening `{`; `\@leftpage` is void, and `\ship@leftpage` invokes `\ship@@leftpage` after the closing `}`; or
2. by a `\box` or `\copy`, in which case `\ship@leftpage` is invoked after the full assignment; `\@leftpage` is not void, and `\ship@leftpage` invokes `\ship@@leftpage` immediately.

```

153 \def\ship@leftpage{%
154   \ifvoid\@leftpage\aftergroup\ship@@leftpage\else\ship@@leftpage\fi}
155 \def\ship@rightpage{%
156   \ifvoid\@rightpage\aftergroup\ship@@rightpage\else\ship@@rightpage\fi}
157

```

```

\ship@@leftpage \ship@@leftpage\ship@@rightpage take the output box, and first make it into
\ship@@rightpage a fully-size source page (with \make@halfpage) and then this is centered horizontally
                  and vertically in half of a target page (with \make@halfpage). Then they
                  are shipped individually or together.
158 \def\ship@@leftpage{\make@halfpage\@leftpage\ship@@leftpage}
159 \def\ship@@rightpage{\make@halfpage\@rightpage\ship@@rightpage}
160

\make@halfpage

161 \def\make@halfpage#1{%
162   \dp#1=\z@
163   \setbox#1=\vbox to\@sourceheight{%
164     \vskip \inv@sourcemag in
165     \vskip \voffset
166     \hbox to\@sourcewidth{\hskip\inv@sourcemag in\hskip\hoffset\box#1\hss}%
167     \vss}%
168   \make@halfpage#1}
169

\make@halfsidebyside The definition of \make@halfpage depends on the target layout.
\make@halfpage 170 \def\make@halfsidebyside#1{%
171   \global\setbox#1=\vbox to\@targetheight{\vss
172     \hbox to.5\@targetwidth{\hss\box#1\hss}\vss}}
173 \def\make@halfpage{\make@halfsidebyside}
174

\make@halftopbottom

175 \def\make@halftopbottom#1{%
176   \global\setbox#1=\vbox to.5\@targetheight{\vss
177     \hbox to\@targetwidth{\hss\box#1\hss}\vss}}
178

\ship@twoup The pages are generally shipped in pairs:
179 \def\ship@twoup{%
180   \begingroup
181     \voffset=-\inv@targetmag in
182     \hoffset=\voffset
183     \global\advance\@physicalpage by 1
184     \count\z@=\@physicalpage
185     \csname &normal@shipout\endcsname\make@fullpage
186   \endgroup}
187

\make@fullsidebyside
\make@fulltopbottom 188 \def\make@fullsidebyside{%
189   \hbox{\box\@leftpage\pagesep@sidebyside\box\@rightpage}}
190 \def\make@fulltopbottom{%
191   \vbox{\offinterlineskip\box\@leftpage\pagesep@topbottom\box\@rightpage}}
192

```

`\make@fullpage` The definition of `\make@fullpage` depends on the layout:

```
193 \def\make@fullpage{\make@fullsidebyside}
194
```

`\pagesep@sidebyside` A vertical or horizontal rule can be inserted. These can be redefined for other
`\pagesep@topbottom` tricks:

```
195 \def\pagesep@sidebyside{%
196   \begingroup
197     \advance\pageseplength by \pagesepoffset
198     \pagesepwidth=\inv@targetmag\pagesepwidth
199     \kern -.5\pagesepwidth
200     \vrule height \inv@targetmag\pageseplength
201       depth -\inv@targetmag\pagesepoffset
202       width \pagesepwidth
203     \kern -.5\pagesepwidth
204   \endgroup}
205 \def\pagesep@topbottom{%
206   \begingroup
207     \pagesepwidth=\inv@targetmag\pagesepwidth
208     \vskip -.5\pagesepwidth
209     \moveright\inv@targetmag\pagesepoffset\hbox{%
210       \vrule height\pagesepwidth width\inv@targetmag\pageseplength}%
211     \vskip -.5\pagesepwidth
212   \endgroup}
213
```

For example it may be helpful to mark the positions of sewing holes along the spine of your booklet. For `landscape` this can be done by redefining `\pagesep@topbottom` and for the more typical portrait style booklet by changing `\pagesep@sidebyside`. The general technique is to use a zero-sized picture which L^AT_EX will think takes up no space. For instance, for letterpaper (11in by 8.5in) you can do something like this in your preamble:

```
\makeatletter
\renewcommand*{\pagesep@sidebyside}{%
  \begingroup
    \setlength{\unitlength}{1in}%
      measurements in inches
    \begin{picture}(0,0)(0,-8.5)%
      zero-sized picture, origin at page top
      \put(0,-1){\makebox(0,0){.}}% mark 1in down from top
      \put(0,-4.25){\makebox(0,0){.}}% mark at page center
      \put(0,-7.5){\makebox(0,0){.}}% mark 1in up from bottom
    \end{picture}%
  \endgroup
\makeatother
```

`\save@booklet` With the Booklet layout, the pages are saved rather than shipped. I have added the signature code to the original macro. This outputs all the pages making

up a signature even if there are still more to come. The page boxes used in `\save@booklet` are assigned initially by `\twoupp@geboxes`.

```

214 \begingroup
215 \let\newbox\relax
216 \gdef\save@booklet#1{%
217   \begingroup
218     \globaldefs=1
219     \ifnum\c@sigcount=\z@\bookletpage=0\fi
220     \advance\bookletpage by 1
221     \addtocounter{sigcount}{1}
222 %%% \expandafter\newbox\csname bookletbox\the\bookletpage\endcsname
223   \expandafter\setbox\csname bookletbox\the\bookletpage\endcsname\box#1%
224 \endgroup
225 \ifnum\c@sigcount=\c@signature      %% PW
226   \twoup@eject%
227   \setcounter{sigcount}{0}%
228 \fi}
229 \endgroup
230

```

`\make@bookletpage` The pages are then printed at the end with the following macros:

```

\booklet@loop 231 \def\make@bookletpage#1{%
\Booklet@@loop 232   \setbox\ifodd#1\@rightpage\else\@leftpage\fi=%
233   \expandafter\box\csname bookletbox\the#1\endcsname}
234
235 \def\booklet@loop{%
236   \count\z@\rightpagenumber
237   \make@bookletpage\leftpagenumber
238   \make@bookletpage\rightpagenumber
239   \ship@twoup
240   \Booklet@@loop
241 }
242
243 \def\Booklet@@loop{%
244   \advance\rightpagenumber by 1
245   \advance\leftpagenumber by -1
246   \ifnum\leftpagenumber<\rightpagenumber\else\expandafter\booklet@loop\fi}
247

```

`\twoupemptypage` This one is easy:

```

248 \def\twoupemptypage{\shipout\hbox{}}
249

```

`\twoup@eject` This clears a whole target page if there is a saved left page. Note that this does not invoke the output routine; i.e., it is not like `\clearpage` or `\supereject`. See `\twoupclearpage` below. (The `booklet` package doesn't need `\twoupeject` which is for non-LaTeX systems).

This is the definition of `\twoup@eject` with the Booklet layout.

```

250 \def\twoup@eject{
```

```

251 \leftpage\bookletpage
252 \advance\leftpage by 3
253 \divide\leftpage by 4
254 \multiply\leftpage by 4
255 \rightpagenumber=1
256 \ifnum\leftpage>\bookletpage
257   \setbox\@leftpage\hbox{}%
258   \makehalfpage\@leftpage
259   \loop
260     \setbox\@rightpage\copy\@leftpage
261     \save@booklet\@rightpage
262   \ifnum\leftpage>\bookletpage
263     \repeat
264 \fi
265 \booklet@loop}
266

```

\twoupclearpage This modification is needed for LaTeX in order to get the last page printed out if the final page is a left page (the catcode business is because `\enddocument` is `\let` to `\bye` in amstex):

```

267 \begingroup
268 \catcode`>=9\relax
269 >>\gdef\twoupclearpage{\clearpage\twoup@eject}
270 >>\expandafter\@temptokena\expandafter{\enddocument}
271 >>\xdef\enddocument{\noexpand\twoupclearpage\the\@temptokena}
272 \endgroup
273

```

\TwoupWrites This is one workaround for the page cross-references problem

```

274 \def\TwoupWrites{%
275   \let\TwoupSaved@write\write
276   \let\TwoupSaved@read\read
277   \let\TwoupSaved@openout\openout
278   \let\TwoupSaved@closeout\closeout
279   \def\write{\TwoupSaved@write-1{}\immediate\TwoupSaved@write}%
280   \def\read{\TwoupSaved@write-1{}\immediate\TwoupSaved@read}%
281   \def\openout{\TwoupSaved@write-1{}\immediate\TwoupSaved@openout}%
282   \def\closeout{\TwoupSaved@write-1{}\immediate\TwoupSaved@closeout}%
283   \let\TwoupWrites\relax}
284

```

\twouparticle The pre-defined layouts. I have taken advantage of LaTeX2e's paper size lengths
\twoupplain to generalise.

```

\twouplandscape 285 \def\twouparticle{\target{\magstepminus1}{\paperheight}{\paperwidth}}
\twouponetoone 286 \def\twoupplain{\target{\magstepminus2}{\paperheight}{\paperwidth}}
287 \def\twouplandscape{\target{\magstepminus2}{\paperwidth}{\paperheight}%
288   \targettopbottom}
289 \def\twouponetoone{\target{\magstep0}{\paperheight}{\paperwidth}}
290

```

```

Set the default for the source.
291 \source{\magstep0}{\paperwidth}{\paperheight}
      Set the defaults for the rule.
292 \pagesepwidth 0pt
293 \pageseplength 6.5in
294 \pagesepoffset 1in
      I also found that \TwoupWrites was really not optional.
295 \TwoupWrites
296
      The default options are twouparticle and thirtytwo pages per signature.
297 \ExecuteOptions{twouparticle,thirtytwo}
298 \ProcessOptions
299
      The end of this package.
300 </prnt>

```

A The code for 2up

Following is a verbatim copy of Timothy Van Zandt's 2up code. I hope that by including this I have partly met his COPYING conditions.

```

%% BEGIN 2up.tex/2up.sty
%%
\def\fileversion{1.2}
\def\filedate{93/01/28}
%%
%% COPYRIGHT 1992, 1993 by Timothy Van Zandt, tvz@Princeton.EDU
%%
%% DESCRIPTION:
%%   2up.tex/2up.sty provides two-up printing for Generic TeX (e.g.,
%%   Plain, LaTeX, AmSTeX and AmS-LaTeX). It produces a standard dvi file,
%%   and does not involve an additional dvi or PostScript filter. It has a
%%   flexible interface for specifying paper size and layout.
%%
%% INSTALLATION:
%%   Put this file where your TeX looks for inputs, under the name 2up.tex.
%%   Name a copy 2up.sty to use as a LaTeX style option, or create a file
%%   2up.sty with the lines:
%%     \input 2up.tex
%%     \endinput
%%
%% DOCUMENTATION:
%%   Input 2up.tex, or include 2up as a LaTeX style option. There is a
%%   good chance you will get the desired layout. (But you will probably
%%   need to generate new font bitmaps to get high quality output.) See

```

```

%% 2up.doc, which might be appended to this file, for detailed
%% documentation.
%%
%% COPYING:
%% Copying of part or all of this file is allowed under the following
%% conditions only:
%% (1) You may freely distribute unchanged copies of the file. Please
%%     include the documentation when you do so.
%% (2) You may modify a renamed copy of the file, but only for personal
%%     use or use within an organization.
%% (3) You may copy fragments from the file, for personal use or for use
%%     in a macro package for distribution, as long as credit is given
%%     where credit is due.
%%
%% You are NOT ALLOWED to take money for the distribution or use of
%% this file or modified versions or fragments thereof, except for
%% a nominal charge for copying etc.

B The documentation for 2up

Following is an almost verbatim copy of the documentation for Timothy Van Zandt's 2up. I hope that by including this I have now completely met his COPYING conditions. The only change that I have made to the original is replacing every occurrence of '{**verbatim**}' by '{**verbtm**'}, so LaTeX does not get confused when processing the current document.

\title{Documentation for 2up.tex:\\
Two-up printing for Generic TeX}
\author{Timothy Van Zandt\thanks{The documentation was put into
\LaTeX\ format by David Todd.}\tvz@Princeton.EDU}
\date{Version \FileVersion\\[3pt] \FileDate}

\maketitle
\thispagestyle{empty}

    "2up.tex"/"2up.sty" allows one to print a document two-up, with
considerable flexibility as to paper size and layout. It produces a standard
dvi file, and does not involve an additional dvi or PostScript filter. It
should work with most \TeX\ macro packages.

{\bf Usage:} Input "2up.tex", or include "2up" as a LaTeX style option.
There is a good chance you will get the desired layout. (But you will probably
need to generate new font bitmaps to get high quality output.) See the rest of
this documentation for detailed information on controlling 2up.tex.

\begin{group}
\def\baselinestretch{.8}\large\normalsize
\tableofcontents
\end{group}
\clearpage

\section{Comparison with other methods}

There are other tools for two-up printing:
\begin{description}
\item[PostScript filters]
These work well as long as you only use PostScript fonts (as opposed to the
usual Metafont fonts). Otherwise, the PostScript filter scales bitmapped
fonts, and the quality is lower than with "2up.tex".

\item[Rokicki's dvidvi]
"dvidvi" is a versatil tool that does much more than
2up printing. However, if only rearranges the pages, and does not adjust the
magnification to ensure that the pages fit properly in a two-up format. It
also adds one more step to the \TeX-dvi-printer cycle. "2up.tex", on the other
hand, combines the changes to \TeX's magnification and page layout with the
rearranging of the pages, all with an easy-to-use interface and from within
your \TeX\ document. (See Section \ref{dvidvi} on using both "2up.tex" and
"dvidvi" together.)

```

```
\end{description}

\section{A warning about fonts}
```

Two-up printing generally involves reducing a document, and thus using font sizes that are not typically found on your system. If you are using bitmapped fonts (standard for \TeX\ users), and you do not have and cannot generate the extra fonts bitmaps, you will find 2up.sty (and any other method of two-up printing) to give very poor quality output.

If you are using a program like Rokicki's "dvips" that can generate extra font bitmaps as needed, you will find that it takes a long time to print your 2up document the first few times, as "dvips" is busy making the extra fonts. This problem will go away. Be thankful you have such an easy way to get extra font bitmaps.

```
\section{Usage}
```

Input "2up.tex". \TeX\ users can include "2up" as a style option.

Then set the target and source layout:

```
\begin{MD}
  \source{mag}{width}{height} \\
  \target{mag}{width}{height}
\end{MD}
```

```
\begin{itemize}
\item The ‘‘source’’ layout is the layout of your document
the way it is usually printed. The ‘‘target’’ layout is the layout when it
is printed two-up.
```

\item <width> and <height> are the true width and height of the paper,
when looking at the output right-side-up.

\item <mag> refers to the source and target magnification. It should be an integer, equal to 1000 times the magnification factor. There are also some magic magnification numbers:

```
\begin{description}
\item[$\setminus magstep<n>$] for a magnification of  $1.2^{n}$  ( $n=0, \dots, 5$ ), or
```

```
\item[$\setminus magstepminus<n>$] for a magnification of  $1.2^{-n}$  ( $n=0, \dots, 5$ ).
```

```
\end{description}
```

Using these magnification values will make best use of the available fonts on your system.

```
\end{itemize}
```

"2up.tex" takes each source page, and centers in half a target page. To get the pages to fit, the magnification of the document typically has to be reduced. If you find that the pages are too crowded, try reducing the target

magnification. If they are too lonely, try increasing the target magnification.

If you want to adjust the positioning of the scaled pages, try changing the values of "\hoffset" or "\voffset" with "\advance" or \LaTeX's "\addtolength".

Don't change the magnification of your document after using the "\target" command, as you will override the settings made by 2up.tex.

You can also specify some options:

```
\begin{MD}
  \targetlayout{options}
\end{MD}
where <options> is a comma separated list with no spaces. Valid
options are:
\begin{namelist}{topbottomxxx}

\item [topbottom] The two source pages are printed one on top of the other.
\item [twosided] Odd pages are always printed on the right or the bottom.
\item [booklet] Pages are printed like a booklet. See Section \ref{booklet}.
\item [Booklet] Like "booklet", but for two-sided printers/copiers.
\item [dvidvi] For arranging in two-up layout with "dvidvi". See Section
\ref{dvidvi}.

\end{namelist}
```

The only other changes you might want to make to your document are the following:

```
\begin{itemize}
\item You have to see to it that the target output is printed with the
correct orientation (landscape or portrait). See the documentation for your
dvi driver for details.
```

\item "2up.tex" will inserts a line between pages if you change the following dimensions:

```
\begin{namelist}{pagesepwidthxxx}
\item [\$setminus$pagesepwidth] Thickness of line. (Default 0pt)
\item [\$setminus$pageseplength] Length of line. (Default 6.5in)
\item [\$setminus$pagesepoffset] Distance from bottom of page to bottom of
line, or (with "topbottom" layout) from side of page to beginning of line.
(Default 1in)
\end{namelist}
```

\item You can, but do not need to, use the following commands:

```
\begin{namelist}{twoupemptypagexxx}
```

\item [\\$setminus\$twoupemptypage] inserts a completely blank half page
in the target.

\item [\\$setminus\$twoupclearpage] \LaTeX\ users: ejects a complete target

page.

```
\item [$_\setminus$twooupeject] Plain \TeX users: ejects a complete target
page.

\end{namelist}
\end{itemize}

\section{Defaults}
```

The following commands set the parameters for some common sources and targets. The definitions of these commands are also useful examples.

For A4 paper, just replace "8.5in" and "11in" in the definitions below by the width and height of A4 paper.

```
\begin{description}
\item [$_\setminus$twouparticle]

This is the default for \LaTeX.
\begin{namelist}{Sourcexx}

\item [Source:] A portrait document on 8.5x11 inch paper with wide margins as
used in \LaTeX's article style, and without marginal notes.

\item [Target:] A landscape document on the same size paper, with the source
pages printed side by side.

\item [Definition:] \hspace{1pt}
\begin{verbtm}
\target{\magstepminus1}{11in}{8.5in}
\source{\magstep0}{8.5in}{11in}
\end{verbtm}
\end{namelist}

If you use narrower side margins, or if you use marginal notes, then you
will need to use "\twoupplain" or \\ "\twouplegaltarget", defined below.

\item [$_\setminus$twoupplain]

This is the default for non-\LaTeX.

It is the same as "\twouparticle", but for source documents with narrower
margins.
\begin{namelist}{Sourcexxx}

\item [Definition:] \hspace{1pt}
\begin{verbtm}
\target{\magstepminus2}{11in}{8.5in}

```

```

\source{\magstep0}{8.5in}{11in}
\end{verbtm}
\end{namelist}

\item [\$\setminus$twouplegaltarget]

\begin{namelist}{Sourcexxx}
\item [Source:] A portrait document on 8.5x11 inch paper with just about any
margins and perhaps with marginal notes.

\item [Target:] A landscape document on legal size paper (8.5x14 inches),
with the source pages printed side by side.

\item [Definition:] \hspace{1pt}
\begin{verbtm}
\target{\magstepminus1}{14in}{8.5in}
\source{\magstep0}{8.5in}{11in}\
\end{verbtm}
\end{namelist}

\item [\$\setminus$twouplandscape]\hspace{1pt}
\begin{namelist}{Sourcexxx}

\item [Source:] A landscape document on 8.5x11 inch paper with just about any
margins.

\item [Target:] A portrait document on the same size paper, with the
source pages stacked vertically.

\item [Definition:] \hspace{1pt}
\begin{verbtm}
\target{\magstepminus2}{8.5in}{11in}
\source{\magstep0}{11in}{8.5in}
\targetlayout{topbottom}
\end{verbtm}
\end{namelist}

\end{description}

\section{True Dimensions}

\TeX\ lets you use ‘true’ dimensions, as in
\begin{verbtm}
\topmargin 1truein
\setlength{\topmargin}{1truein}
\end{verbtm}
This sets the length to 1 inch
as it appears on the page, no matter what the magnification.

```

Once you use ‘true’ dimensions, it is impossible to change the magnification of your document, and hence it is almost impossible to use 2up.tex. You will get an error like:

```
\begin{verbatim}
! Incompatible magnification (833);
the previous value will be retained (2000).
\end{verbatim}%
```

The use of ‘true’ dimensions might be hiding in macros or style files you are using. For example, Plain \TeX’s “\magnification” command uses true dimensions; use “\mag” instead, and then set “\hsize” and “\vsize” appropriately scaled. If you can’t find the culprit ‘true’ dimension in your document or input files, try putting this on the (very) first line of your document:

```
\begin{verbatim}
\mag 143 \voffset 1truein \mag 1000
\end{verbatim}
```

You will get the error listed above wherever true dimensions are used (and in some other places as well).

\section{Page Cross-References}

Page cross-references (e.g., in an index or table of contents) will not be accurate with “2up.tex”, because finished pages are not immediately shipped out. This can also cause problems with some special \LaTeX\ styles that have multiple “.aux” files (e.g., for each chapter).

To get better, but not perfect, page cross-references, try putting the command

```
\begin{verbatim}
\begin{TwoupWrites}
\end{TwoupWrites}
\end{verbatim}
```

at the beginning of your document, after inputting “2up.tex”. This is good for drafts, and may fix problems with \LaTeX\ styles that have multiple “.aux” files. “\TwoupWrites” makes “\write” and “\read” “\immediate”, if you know what that means. It might cause problems of its own, but try it and see.

To get accurate page cross-references:

```
\begin{verbatim}
\begin{enumerate}
\item Run the job without "2up.tex", until all cross-references
are properly resolved. Run any index utility at this point.
\end{enumerate}
\end{verbatim}
```

```
\begin{verbatim}
\item Run the job ONE MORE TIME with "2up.tex"; it will use the
correct cross-references from the previous runs. (In \LaTeX\ documents,
it is useful at this point to include the "\nofiles" command, so that
the correct cross-references are preserved.)
\end{enumerate}
\end{verbatim}
```

```
\section{Booklets\label{booklet}}
```

Here are some special considerations for making booklets:

```
\begin{itemize}
```

- \item Use the "booklet" target layout if your printer or copier cannot print two sides directly. "2up.tex" prints out the "tops" of the pages, and then the "bottoms", so that you can copy or print on both sides by doing one side, flipping the output over, and doing the other side.

- \item Use "Booklet" if your printer or copier can print directly on two sides.

- \item You must have enough memory and box registers to hold all the pages in the document. A Big\TeX\ should be able to handle at least a 32-page booklet.

- \item Sometimes booklet printing is part of the design of a document, rather than an afterthought. In this case, you should set up the margins for the target half-page rather than using "2up.tex" to scale the document. For example, if using \LaTeX, 8.5x11 inch paper, \LaTeX's twoside style option, and headings, try the following page parameter changes:

```
\begin{verbatim}
\setlength{\oddsidemargin}{-0.2in}
\setlength{\evensidemargin}{-0.5in}
\setlength{\textwidth}{4.2in}
\setlength{\textheight}{6.5in}
\setlength{\topmargin}{-.4in}
\end{verbatim}
```

If you do this, "2up.tex" isn't adjusting margins or scaling the document. You could therefore get by without "2up.tex" by using "dvidvi".

```
\end{itemize}
```

```
\section{Using dvidvi\label{dvidvi}}
```

With the "dvidvi" layout option, "2up.tex" takes care of adjusting the margins, and you then use "dvidvi" to arrange the pages in a two-up format. The advantage is that cross referencing comes out right. The disadvantage is that it involves one more step.

Start by \TeX ing your document with "2up.tex" and the "dvidvi" layout option. Then run the dvi file through "dvidvi". Specify the offsets for "dvidvi" at the middle of the page. E.g., for a side-by-side layout on 8.5x11in paper, use

```
\begin{verbatim}
dvidvi '2:0,1(5.5in,0in)' foo bar
\end{verbatim}
```

For other paper sizes, replace "5.5in" by half the target paper width. For the "topbottom" layout, reverse the dimensions, e.g., (0in,5.5in). For booklet printing, see the

the documentation for "dvidvi".

```
\section{Compatibility}\label{compatibility}}
```

These macros should work with most \TeX\ macro packages, except for the following possible but unlikely compatibility problems:

```
\begin{itemize}
```

- \item If you use a macro package other than \LaTeX\ that does unusual things to end a document and/or that modifies the definition of "\end", you may find that the last page is not printed or that an extra page with headings is inserted at the end of the document. This is fixable on a case-by-case basis. See the redefinition of "\end" in "2up.tex".

- \item "2up.tex" might not work if you meddle with \TeX's "\shipout" primitive after loading "2up.tex".

- \item If the first page of the source document is not on the first two-up target page (possible, for example, with two-sided printing and the "booklet" option, but generally unlikely), "\special"s that come at the beginning of the document also do not get onto the first page of output. This can mess up "\special"s for landscape printing or including a PostScript header file. In this case, you have to specify these things as command line options when using your dvi driver.

```
\end{itemize}
```

```
\section{Changes}
```

```
\begin{namelist}{V0.9xxx}
```

```
\raggedright
```

- \item [V0.9a] Everything redone. Too many differences to point out.

- \item [V0.9b] Interface redone again. "booklet" option added.

- \item [V0.9c] Pages ship out a little earlier. A few bugs fixed.

Parameters "\pagesepwidth" and "\pagesthickness" added.

- \item [V0.9d] Fixed bug with "\twoupclearpage" and "\twoupeject".

- \item [V0.9e] Made pages be counted (from dvi driver's viewpoint) by the physical page number.

- \item [V0.9f] Parameter "\pagesepoffset" added, and "\pagesthickness" changed to "\pagesepwidth".

```

\item [V1.0] None. Just seemed seemed like it was time to call it 1.0

\item [V1.1] Added "Booklet" and "dvidvi" target layouts.

"\hoffset" and "\voffset" in source document now have expected effect.

\item[V1.2] Fixed incompatibility problem with AmS-\TeX/AmS-\LaTeX.

Added "\TwoupWrites" command.

\end{namelist}
\end{document}
% END 2up.doc

```

I used a slightly modified version of `2up.doc` as one of the test documents for the booklet package. First, to get a baseline, I followed the instructions in `2up.doc` and edited and printed it using `2up` to get a booklet.

I then copied `2up.doc` to `2updoc.tex` and then edited the new file so that the first part of the preamble became:

```

%% BEGIN 2updoc.tex
%% ...
\documentclass[12pt,twoside]{article}
\usepackage[print,four]{booklet} % change options to suit
\usepackage{ifpdf} % from CTAN

\ifpdf
  \pdfoutput=1
  \setpdftargetpages
\else
  \checkforlandscape
  \ifuselandscape
    \special{dvips}
    \ifprintoption
      \special{!TeXDict begin <</Duplex true /Tumble true>> setpagedevice end}
    \fi
  \fi
\fi

\def\FileDate{...}

...
\iffalse
  \input 2up.tex
...
  % \fi and \makeatletter were here
\% PAGE NUMBERING:
...

```

```
\@ifundefined{target@stop}...
\fi      % this \fi and \makeatletter moved down from before NUMBERING
\makeatletter

% CONTENTS      % no changes after this
...
```

Processing, printing and folding this to make a booklet enabled me to determine if the package effectively produced the same final result as 2up.
